Remote communities often have limited medical infrastructure with few or no hospitals, inadequate number of health professionals and scarce medical supplies. Governments need to be prepared to support citizens in these areas.

The Twin Otter can offer a unique set of solutions:

- Reach isolated communities
- Carry up to 2.5 tons of supplies
- Transport medical staff up to 19 passengers
- Deploy personnel to support the community
- Transfer critically ill patients (multi-patient transfer capability)

The Twin Otter’s unique design is the ideal fit for the EpiGuard® EpiShuttle, allowing for easy loading of critically ill patients. The EpiShuttle is a single-patient isolation system, specially designed for transport of contagious patients. The unit protects the environment from an infected patient, but can also be used to protect the patient from a contaminated environment.

The Twin Otter is renowned for its ability to perform in a multitude of environments, providing operators with versatility in a single platform. Landing gear options for the Twin Otter Series 400 aircraft include straight floats, amphibious floats, wheel skis, tundra tires and wheel gear.

In remote communities, the Viking Twin Otter Series 400 can help save lives.

• Unique Versatility
• Extremely Low Operating Cost
• Highest Dispatch Reliability in its Category

The Twin Otter’s unbeatable short take-off and landing capability, combined with its rugged structure, enables the aircraft to operate in all kinds of terrain, including unimproved runways as short as 450 meters.
